Community 365 Roundtable Meeting Early Detection and Screening

22 June 2021

Prevention, Early Detection and Screening Network

- Established in June 2020
- Bringing together 45+ stakeholder organisations, including E.C.O. Member Societies, Patient Advisory Committee, Community 365 and invited stakeholders
- Aims to drive fresh and stronger consensus in areas of primary and secondary cancer prevention
- New name: **Prevention, Early Detection and Screening Network**

european cancer ORGANISATION

Prevention, Early Detection and Screening Network

The Prevention, Early Detection and Screening Network brings together a wide range of experts and stakeholders, from the European Cancer Organisation Member Societies, Patient Advisory Committee and other stakeholders, with the aim of driving fresh and stronger consensus in areas chosen by its participants for focus.

Member Societies

European Association of Urology
EANM
ECL Association of European Cancer Leagues
EASL The Home of Hepatology
European Hereditary Tumour Group
European Oncology Nursing Society
ERS European Respiratory Society
ESHI MT
EUSOMA
EUSOBI
European Society of Pathology
ESSRF
EUROSKIN
esso The European Society of Surgical Oncology
ipvs International Papillomavirus Society
IPOS International Psycho-Oncology Society
UNITED EUROPEAN GASTROENTEROLOGY ueg

Patient Organisations

EGPRN
EQuiP
EHNS European Head & Neck Society

Community 365 INITIATIVE OF THE EUROPEAN CANCER ORGANISATION

Advocacy Paper

- Advocacy Paper on Early Detection and Screening will be published in September, based on this meeting's presentations and discussions. It will outline today's key recommendations in the context of the implementation of Europe's Beating Cancer Plan and the EU Cancer Mission
- If you wish to input into the Advocacy Paper, contact Norbert Couespel norbert.couespel@europeancancer.org
- This Advocacy Paper will be used for further engagement with the European Parliament (including the Special Committee on Beating Cancer), the European Commission and EU agencies to take these recommendations forward
- Paper will also form the basis of our session at the European Cancer Summit 2021 on 17 November at 9:15-10:45 CET

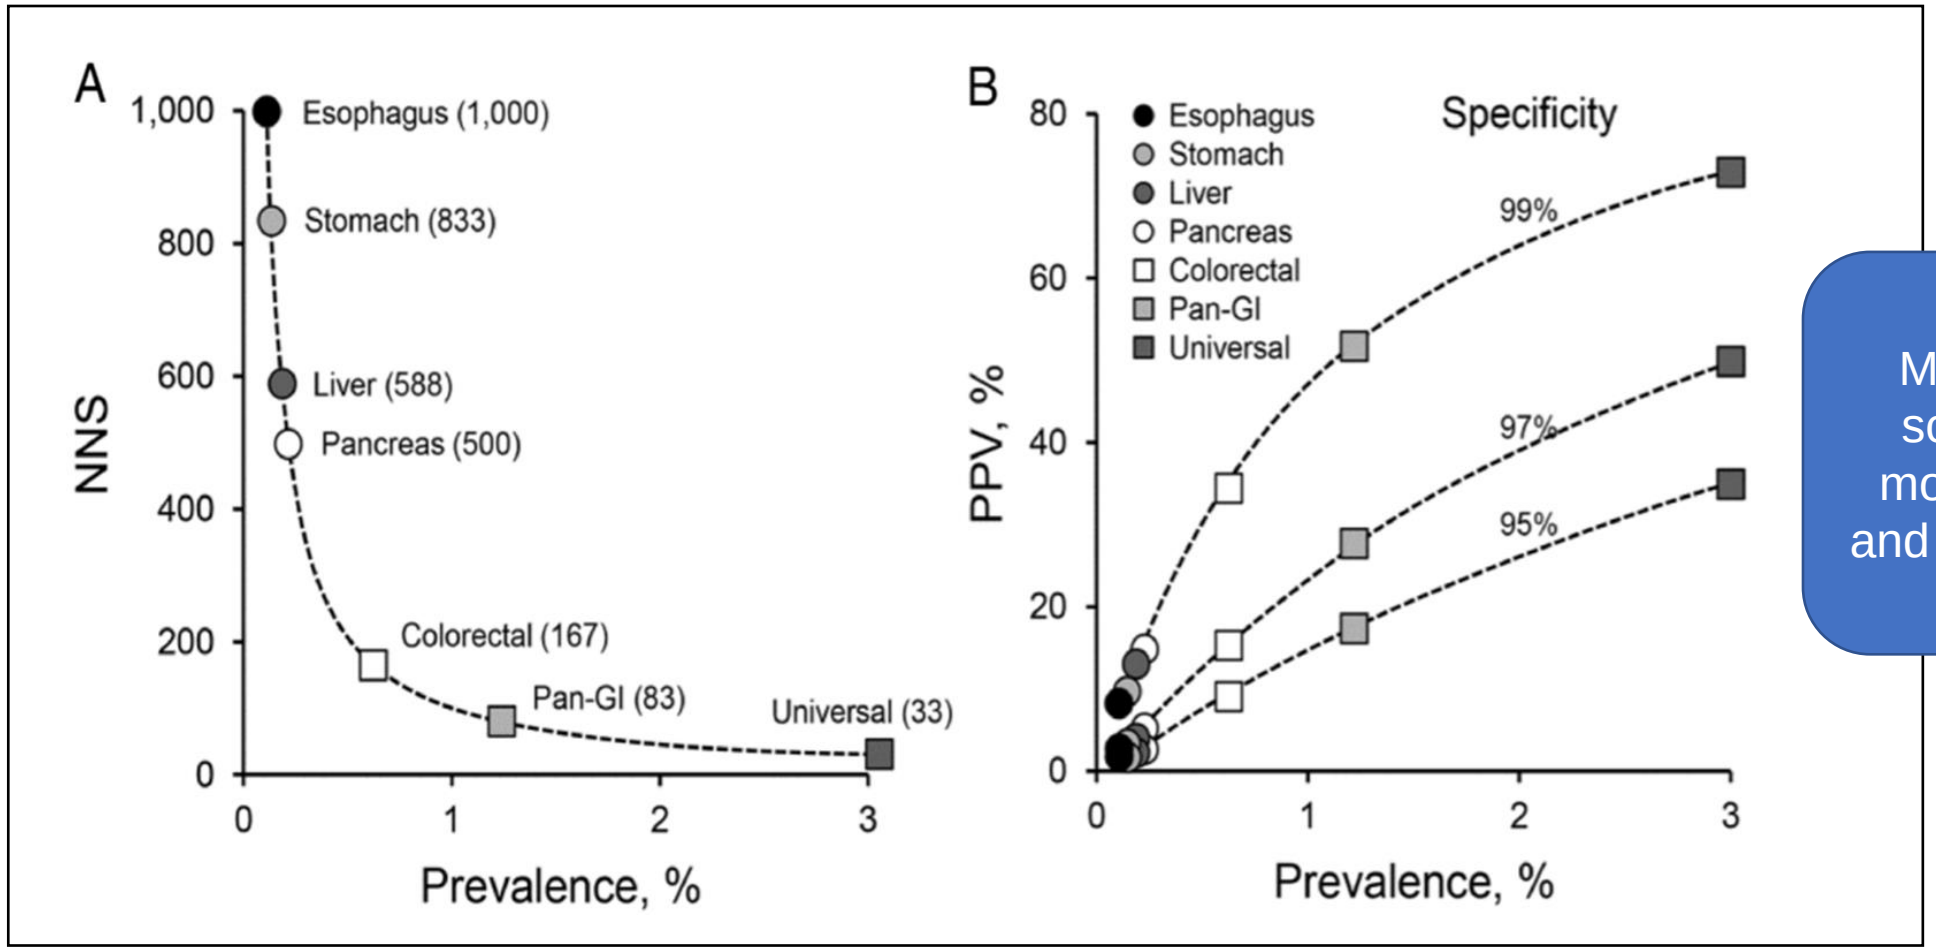
The power of aggregate prevalence



Multi-cancer screening is more effective and cost efficient

Source: Ahlquist, Nature Precision Oncology (2018) 2:23; doi:10.1038/s41698-018-0066-x

There are several approaches to multi-cancer early detection

Ideal features

- **Effective early-stage detection**
  - Sensitivity
  - Compliance
  - Access
- **High specificity**
- **Accurate site prediction**
- **Non-invasive**
- **Affordability**

Sampling options

- **Imaging with clearer vision**
- **Target the circulation**
  - Blood
  - Urine
  - Breath
  - Saliva
- **Capitalize on tumor exfoliation**
  - Stool
  - Tampon

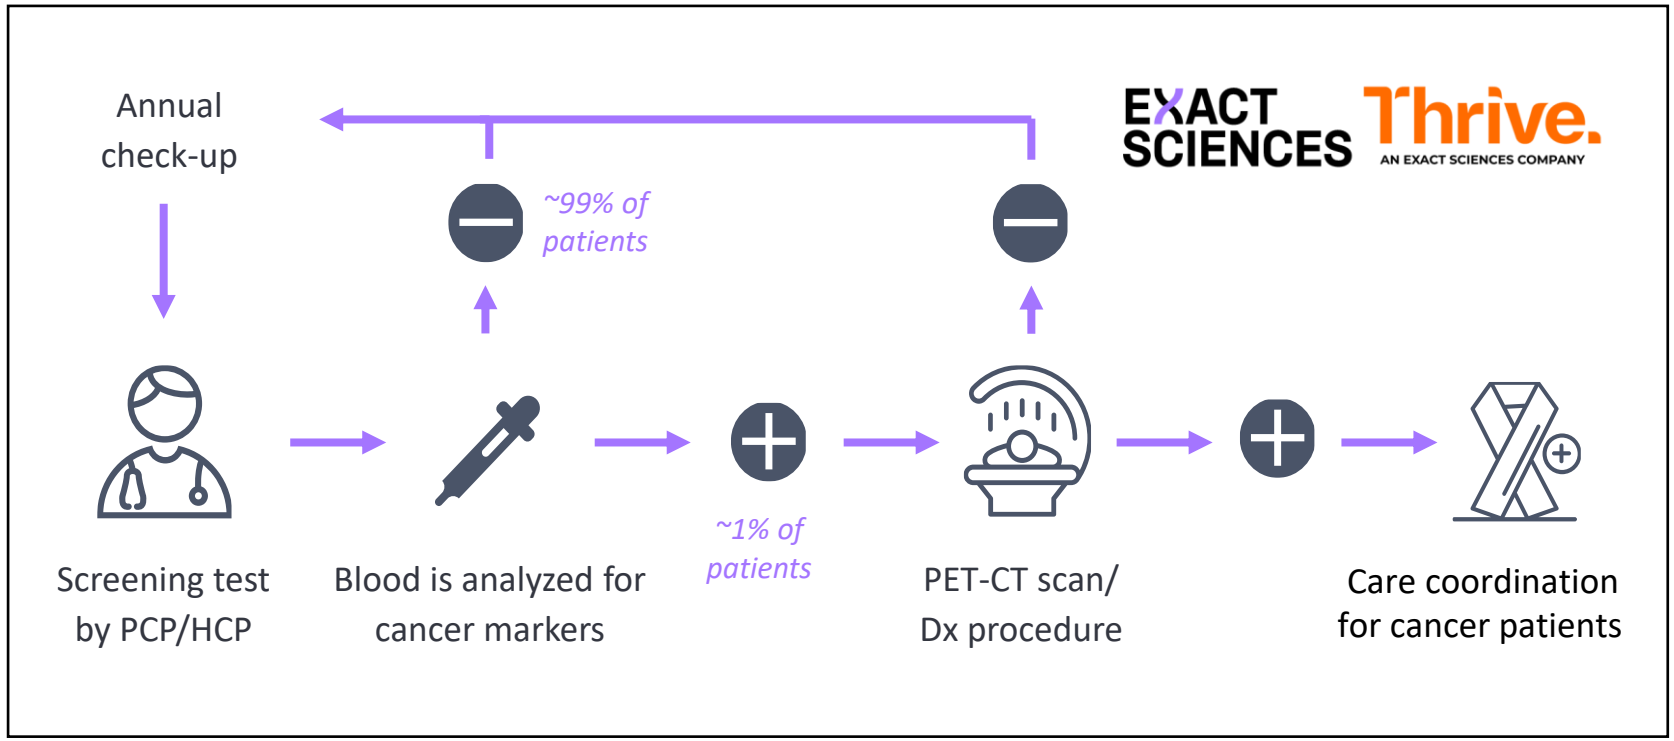
Potential markers

- **Whole cells**
- **Proteins**
- **Metabolites** (e.g. VOCs)
- **RNA**
- **DNA**
  - Genetic (e.g. mutations)
  - Epigenetic (e.g. aberrant methylation)

european cancer ORGANISATION

CancerSEEK is our approach to multi-cancer early detection

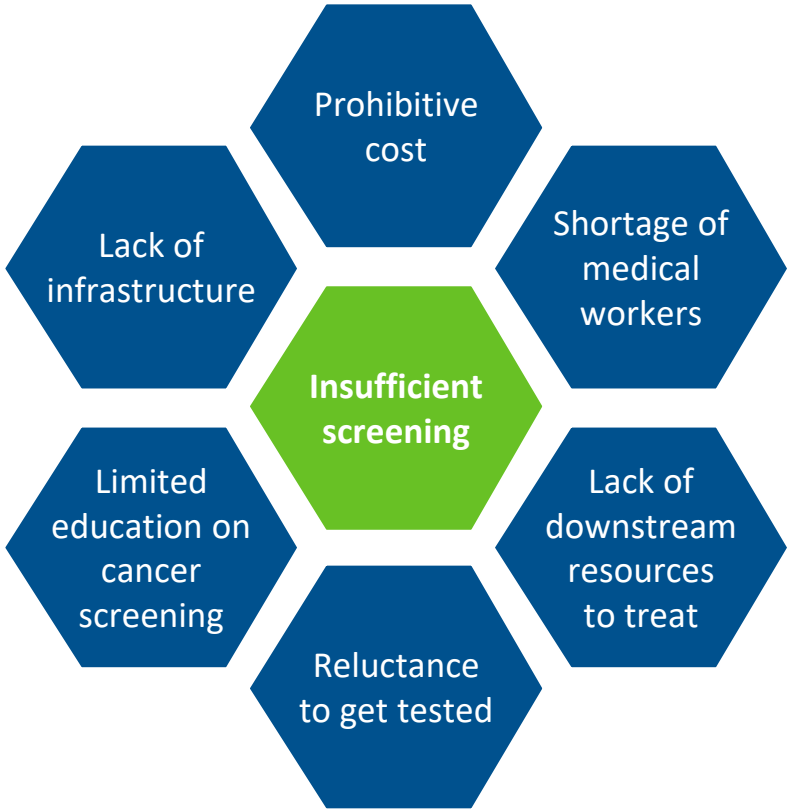
Our Proprietary Integrated Service Model

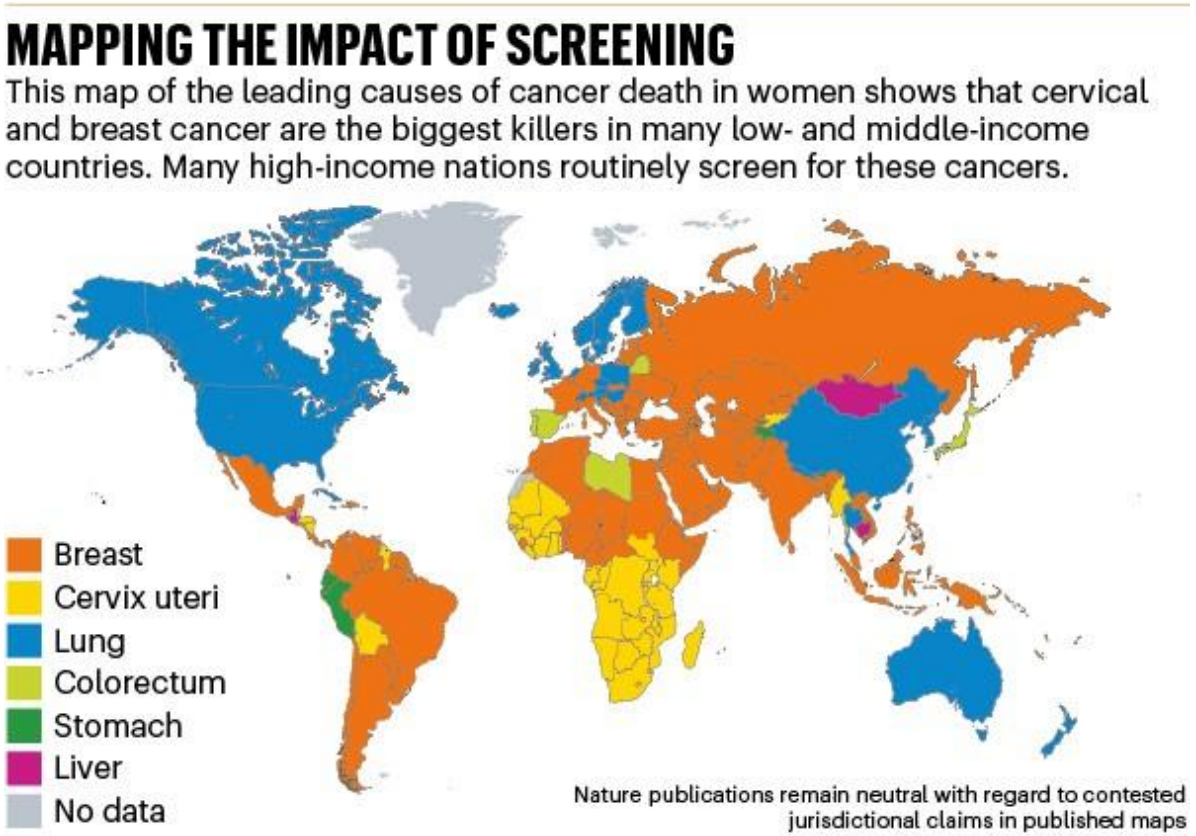


- **Multiple unscreened cancers:** In an interventional study of 10,006 women, CancerSEEK identified 26 cancers: 23 of which wouldn't have been screened for[1]
- **Reflex testing:** A "rule-in" approach that pairs high specificity testing with confirmatory PET-CT
- **Focused on the patient:** Participants were counselled about test implications and educated on their need to continue SOC cancer protection

Source: A. M. Lennon et al., Science (2020). 1 Cancers identified with screening alternatives were breast (1), colorectal (2).
There were 9 lung cancers identified, but lung screening is only available for high-risk individuals, who were not enrolled in the DETECT-A study

WHO estimates 11M annual cancer cases diagnosed in LMICs by 2030





Source: E. Sohn. Nature 579, S17-S19 (2020) doi: https://doi.org/10.1038/d41586-020-00848-1; F. Bray et al. Ca. Cancer J. Clin. 68, 394–424 (2018);

What's needed to get there?

- Finalize assay and algorithm
- Define optimal target population
- Standardize case management approach
- Support access to diagnostic follow-up and appropriate treatment
- Perform rigorous cost-effectiveness analyses
- Work with academia, professional societies, regulatory bodies and payors

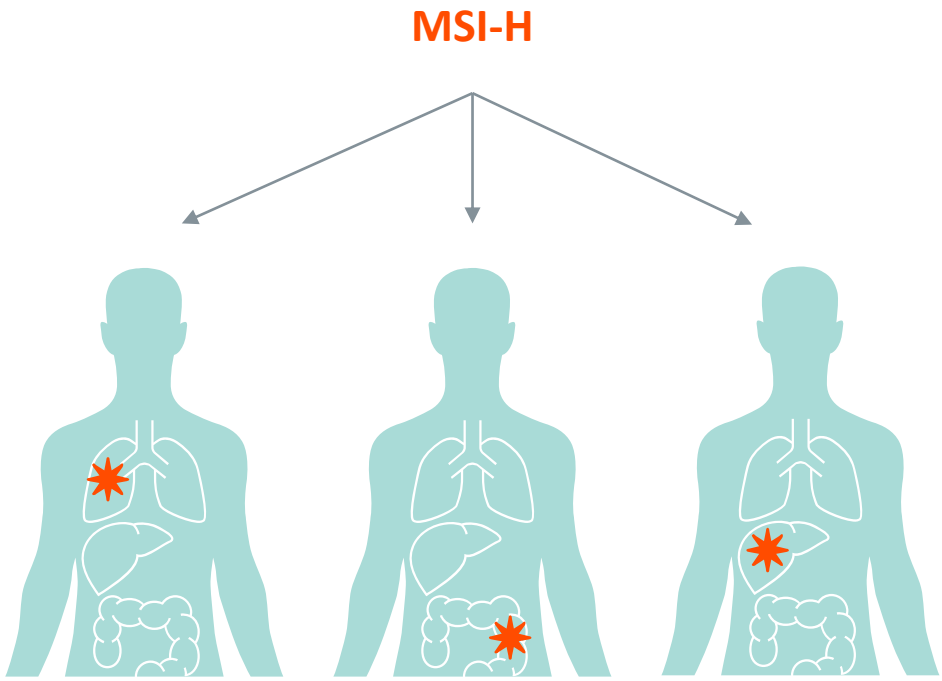
Pembrolizumab is the first FDA approved cancer treatment based on a common biomarker

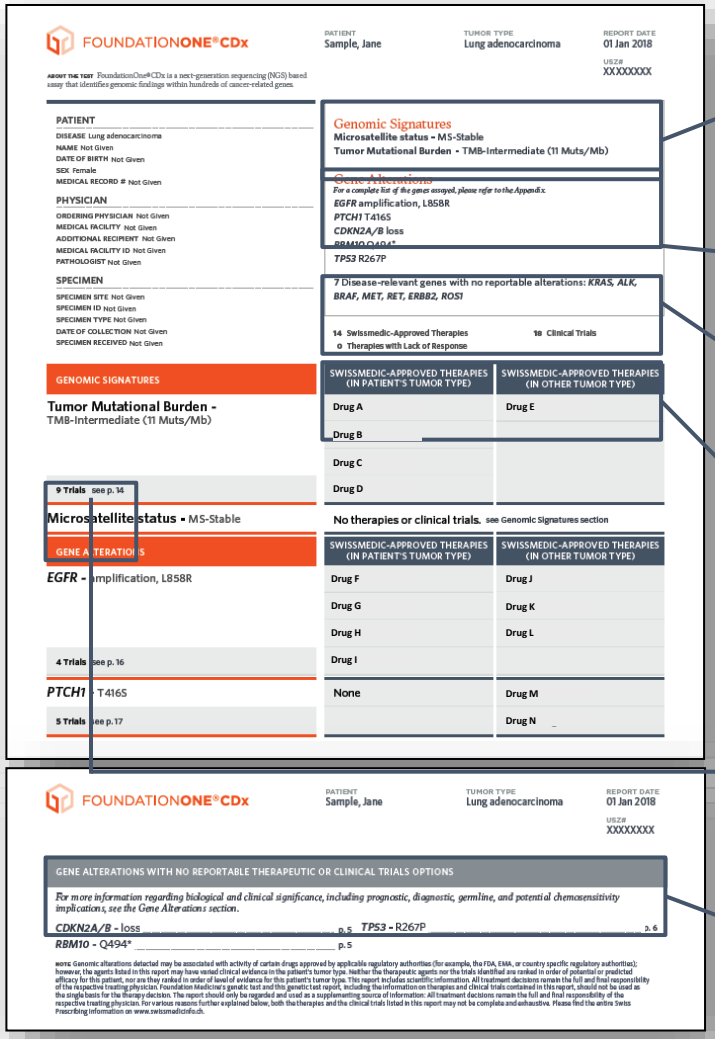
- Traditionally in oncology **approvals were based on a tumour type or a biomarker within a tumour type**
- For the first time, the FDA has **‘approved a drug based on a tumour's biomarker without regard to the tumour’s original location’**
- Pembrolizumab is indicated for the treatment of patients with unresectable or metastatic solid tumours possessing a **microsatellite instability-high (MSI-H) biomarker**



FDA: US food and drug administration; MSI-H: microsatellite instability-high.

FDA press release (2017) https://www.fda.gov/newsevents/newsroom/pressannouncements/ucm560167.htm

Molecular profiling provides actionable insights



Genomic signatures

Tumour mutational burden and microsatellie instability status, which may predict response to immunotherapy[1–4]

Gene alterations

Clinically relevant alterations in 324 tested cancer-related genes

Pertinent negative results

Rules out important alterations that are not present

Therapies with clinical benefit

Swissmedic-approved therapies for your patient‘s genomic signatures and gene alterations

Clinical trials

Relevant trials for which your patient may be eligible, based on their genomic profile and geographic location

Genomic findings with no reportable options

To help you rule out uncertainty and determine the appropriate course of action

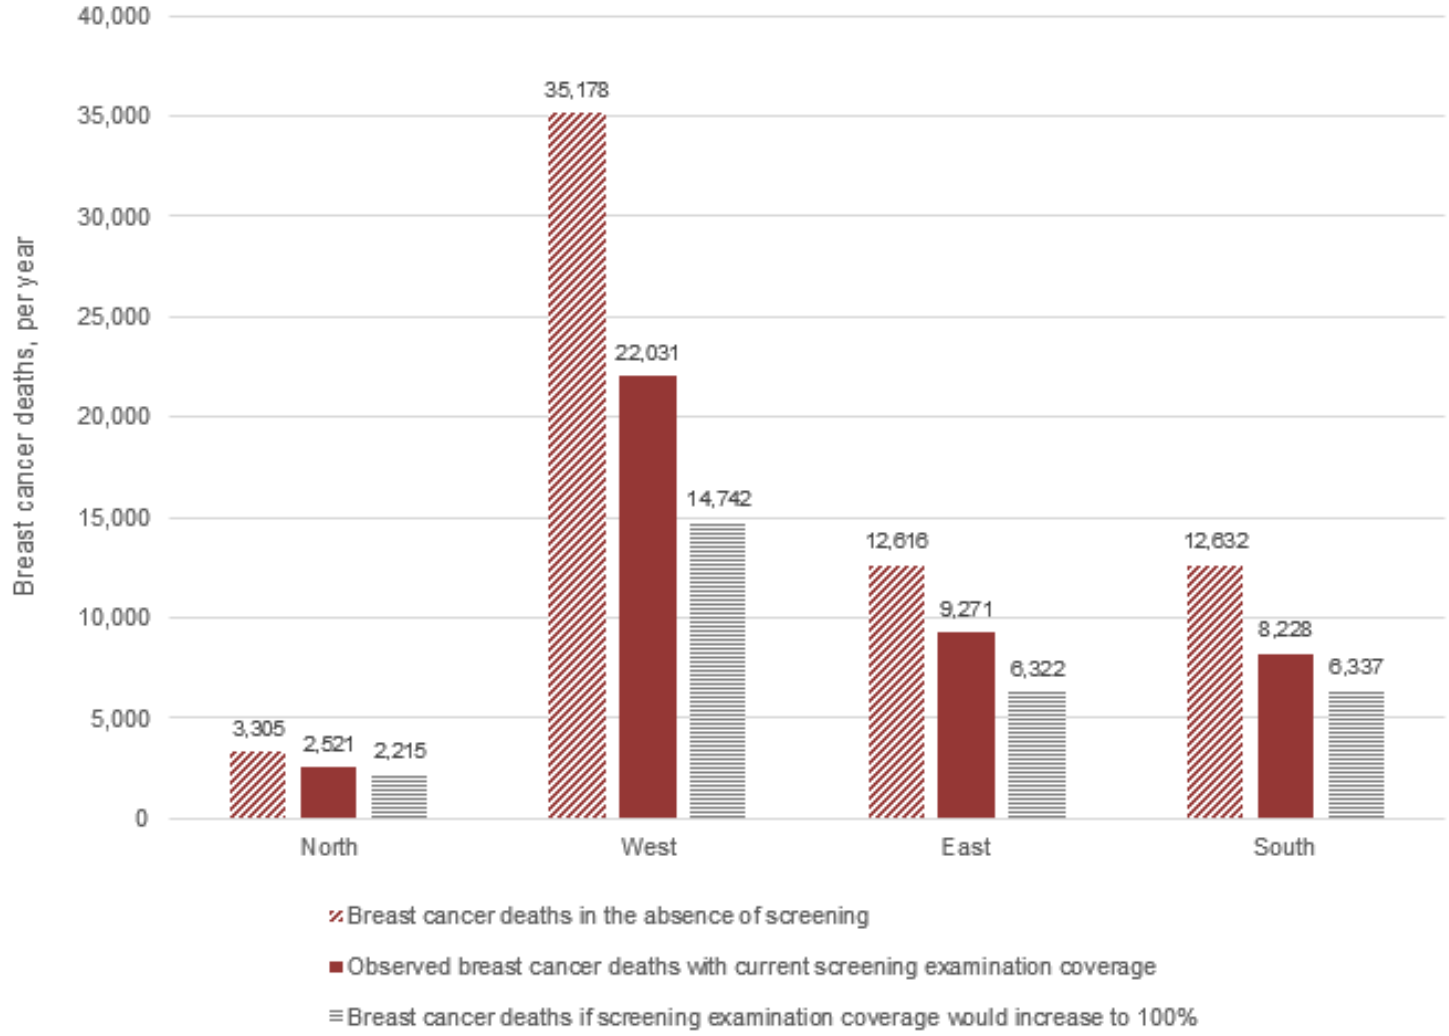
Abstract

Currently, all European countries offer some form of breast cancer screening. Nevertheless, disparities exist in the status of implementation, attendance and the extent of opportunistic screening. As a result, breast cancer screening has not yet reached its full potential. We examined how many breast cancer deaths could be prevented if all European countries would biennially screen all women aged 50 to 69 for breast cancer. We calculated the number of breast cancer deaths already prevented due to screening as well as the number of breast cancer deaths which could be additionally prevented if the total examination coverage (organised plus opportunistic) would reach 100%. The calculations are based on total examination coverage in women aged 50 to 69, the annual number of breast cancer deaths for women aged 50 to 74 and the maximal possible mortality reduction from breast cancer, assuming similar effectiveness of organised and opportunistic screening. The total examination coverage ranged from 49% (East), 62% (West), 64% (North) to 69% (South). Yearly 21 680 breast cancer deaths have already been prevented due to mammography screening. If all countries would reach 100% examination coverage, 12 434 additional breast cancer deaths could be prevented annually, with the biggest potential in Eastern Europe. With maximum coverage, 23% of their breast cancer deaths could be additionally prevented, while in Western Europe it could be 21%, in Southern Europe 15% and in Northern Europe 9%. Our study illustrates that by further optimising screening coverage, the number of breast cancer deaths in Europe can be lowered substantially.

KEYWORDS

breast cancer mortality, breast cancer mortality reduction, breast cancer screening, screening coverage, screening guidelines

Figure 2: Annual number of observed and preventable breast cancer deaths, ages 50-74, per European region



Northern Europe: Denmark, Estonia, Finland Iceland, Latvia, Lithuania, Norway and Sweden.
Western Europe: Austria, Belgium, France, Germany, Ireland, Luxembourg, The Netherlands, United Kingdom and Switzerland.
Eastern Europe: Bulgaria, Czech Republic, Croatia, Hungary, Poland, Romania, Slovakia and Slovenia.
Southern Europe: Cyprus, Gibraltar, Greece, Italy, Malta, Portugal and Spain

These analyses illustrate that breast cancer screening in Europe already has a substantial impact by preventing nearly 21,700 breast cancer deaths per year.

Through introducing a hypothetical 100% coverage of screening in the advised target age groups, the number of breast cancer deaths of European women could be further reduced by almost 12,500 per year.

This represents an additional 23% in Eastern Europe, 21% in Western Europe, 15% in Southern Europe and 9% in North.

Risk-based screening (“patient centric”) is the best concept

Risk assessment **Stratification** **Intervention based on risk**

Scientific umbrella organisation

Aiming to improve digestive health

Uniting 30,000 specialists from every field
In digestive health

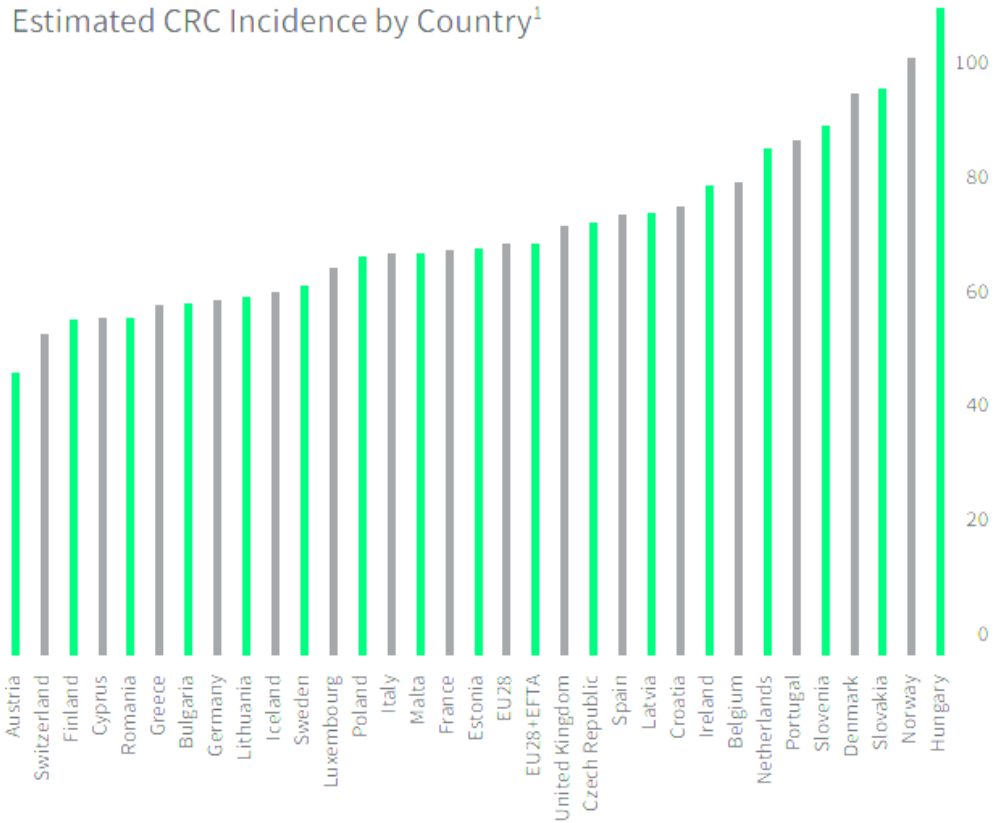
ueg.eu

european cancer ORGANISATION

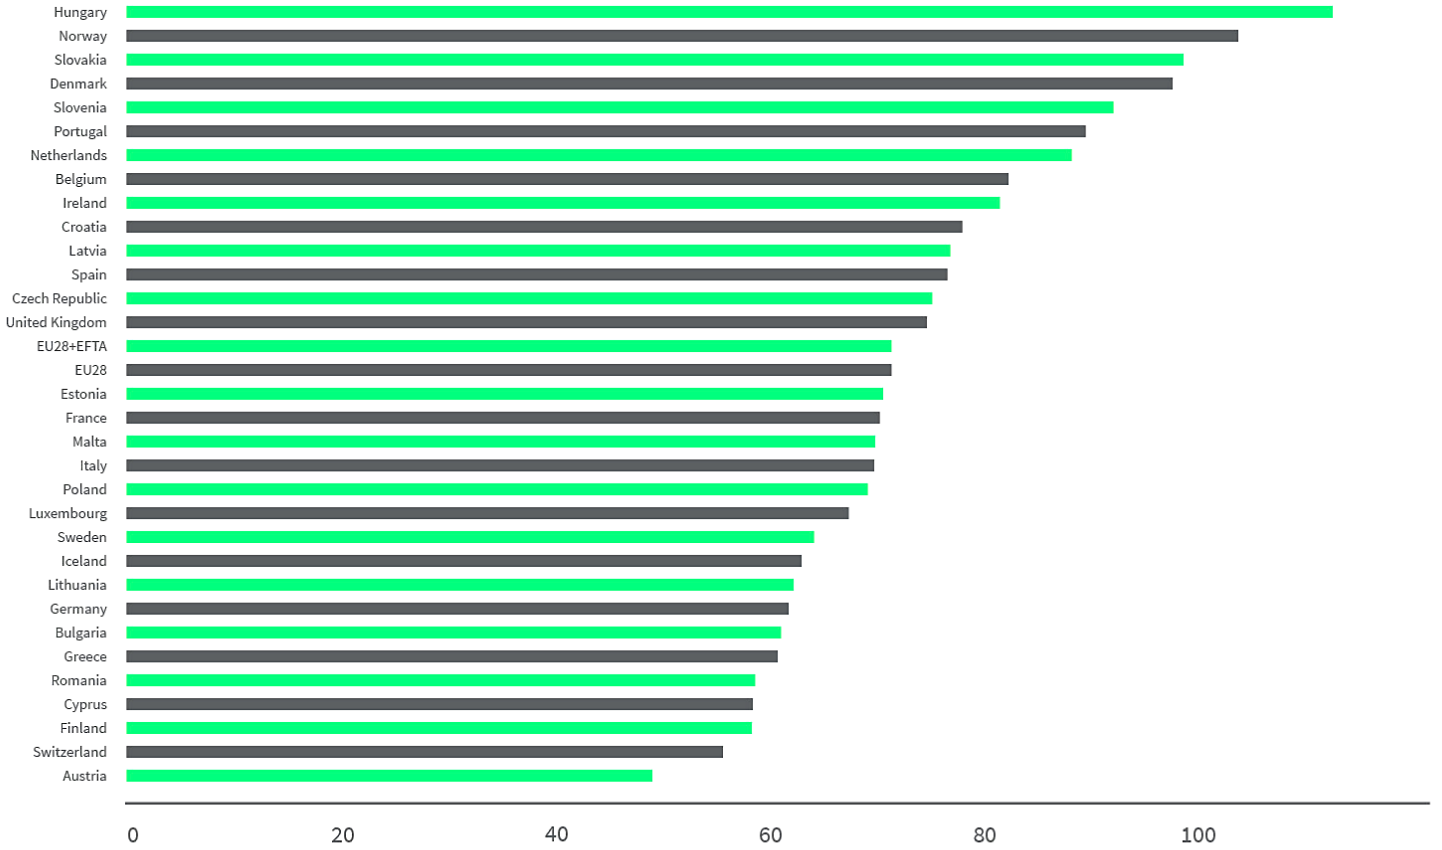
Coordinating European Action against Colorectal Cancer

Call to policymakers:

United European Gastroenterology (UEG) calls for the implementation of organised, population-based screening programmes across the entirety of the EU and for Member States to improve the coverage and quality of existing programmes to reduce colorectal cancer (CRC) rates.

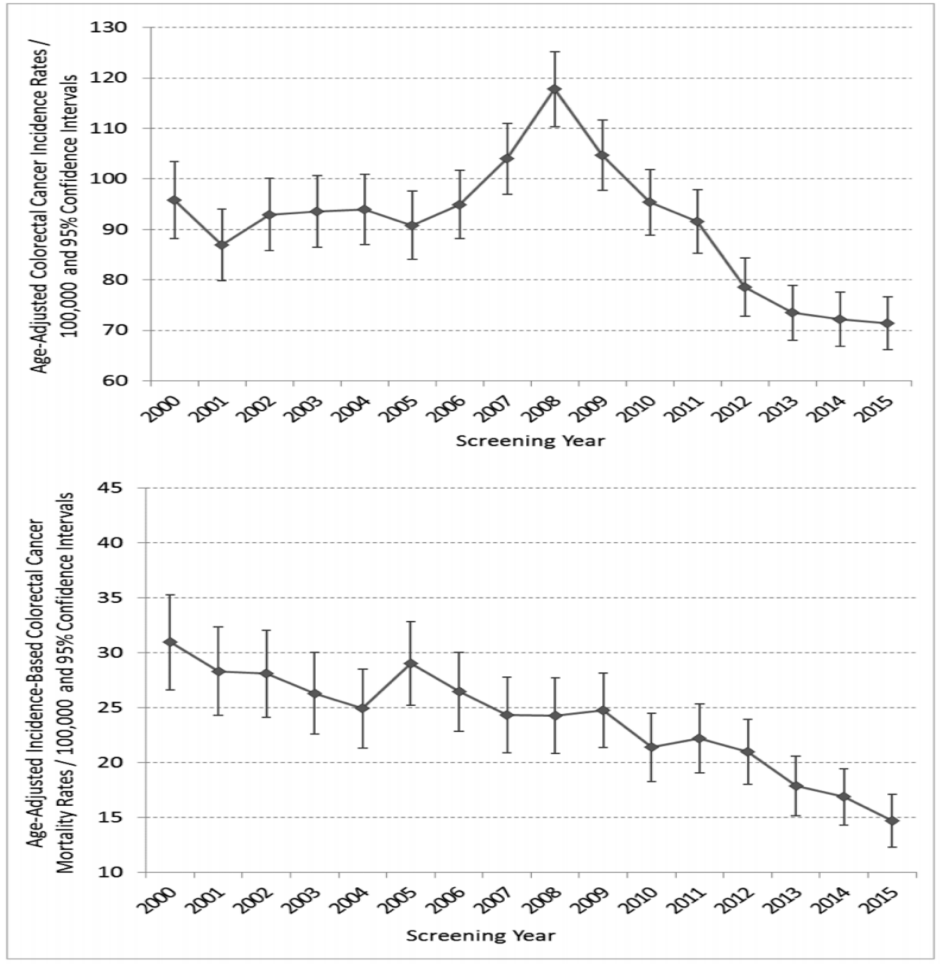


Estimated CRC Incidence by Country



European Parliament. (2010). Written declaration on fighting colorectal cancer in the European Union. Available at: http://www.europarl.europa.eu/sides/getDoc.do?pubRef=-//EP//NONSGML+WDECL+P7-DCL-2010-0068+0+DOC+PDF+V0//EN&language=EN

Effect of screening programs



Global trends in incidence and mortality from CRC over the period 2000-2015

→ Incidence: **-25.5%**

→ Mortality rates: **-52.4%**

Levin TR et al, Gastroenterology, 2018

Vast inequalities in colorectal cancer screening programmes design and participation across Europe

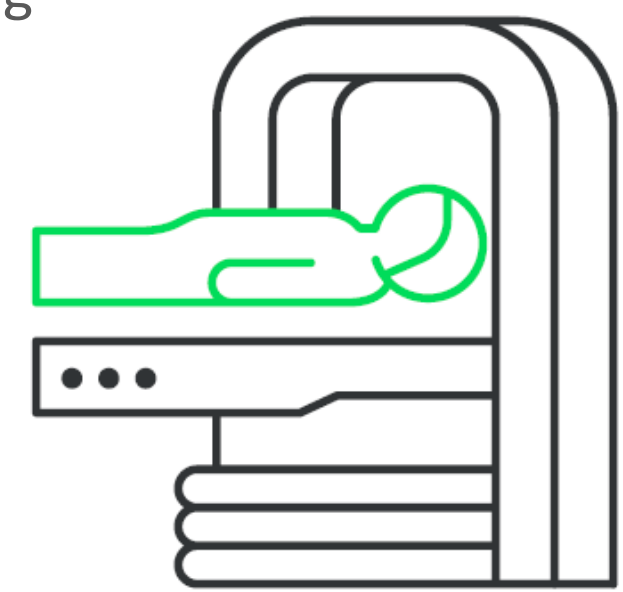
Bulgaria, Greece, Latvia, Romania and the Slovak Republic currently do not have population-based CRC screening programmes[3]

Prevention and treatment strategies, including the implementation of screening programmes could reduce CRC mortality by 27% by 2030[6]

CRC has a 5-year survival rate of 90% when detected at stage 1 and 71% at stage 2[7]

Innovate on screening techniques & strategies

- Identify & better understand the barriers for screening experienced by disadvantaged groups
- COVID-19 → significant disruption of existing CRC screening programs → define protected path for CRC screening
- Next generation screening tools with robust biomarkers for the identification of patients at risks
- Innovate the screening of upper digestive cancers (oesophageal, gastric), to enable screening with adapted tools for risk individuals and/or high incidence European countries



european cancer ORGANISATION

UEG calls on the EU and all Member States to:

Incentivise Member States to **improve the organisation of their existing programmes** to further increase the coverage and quality of CRC screening across Europe

Encourage the implementation of **organised CRC screening programmes across the entirety of the EU** in accordance with EU screening guidelines

Undertake updates of **European CRC screening guidelines and screening progress reports every two years**, which reflect scientific evidence from current best practice

Number of deaths as a result of investigation/management# with lung cancer	2	0.02
Number undergoing invasive testing* for benign disease (not including surgery)	61	0.5
Number undergoing lung resection for benign disease (5% benign resection rate)	9	0.07
Number with major complication from invasive testing/treatment# for benign disease	0	0
Number deaths as a result of invasive testing/treatment# for benign disease	0	0

* Bronchoscopy or biopsy #Bronchoscopy, biopsy or surgery

Eligibility optimisation and participation

- How to identify the ‘high risk’
- Risk models versus age and smoking status alone
  - No consensus on which model/ threshold to use
- Participation promising in UK pilots (30-50%)
  - LSUT 53% participation [1]
  - Compared with 3-4% in US [2]

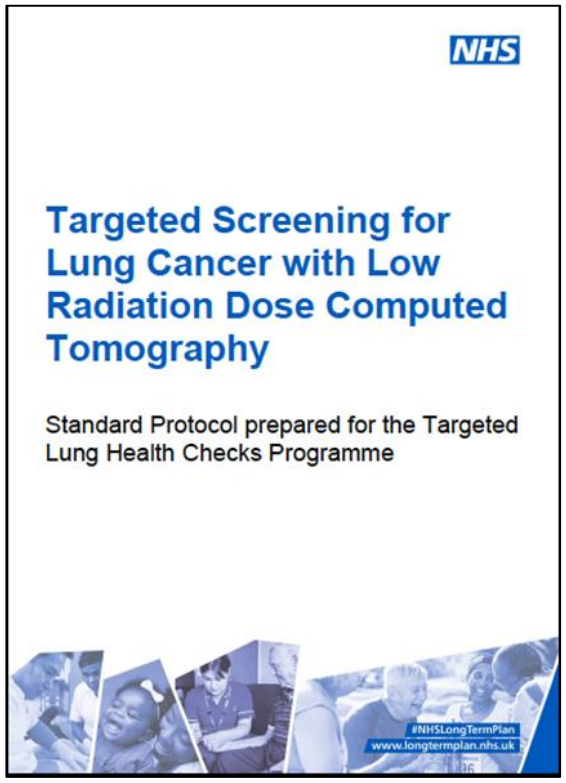
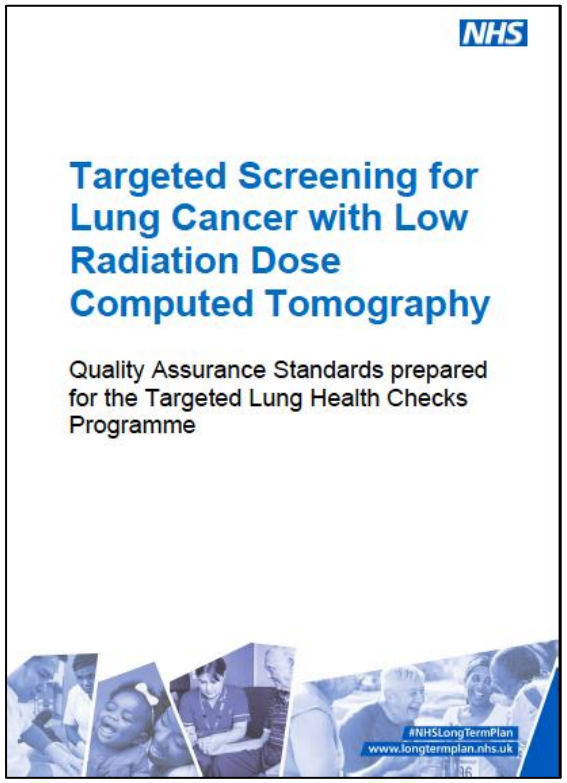
Service implementation and quality assurance





- Capacity and Infrastructure
- Governance
- Selection, risk assessment, consent, clinical pathways
- Low dose CT technical standards
- Smoking cessation
- Scan intervals
- Non-attendance and exiting programme
- Management of findings
- Communication
- Data management and evaluation

Hugosson J et al. Eur Urol 2019

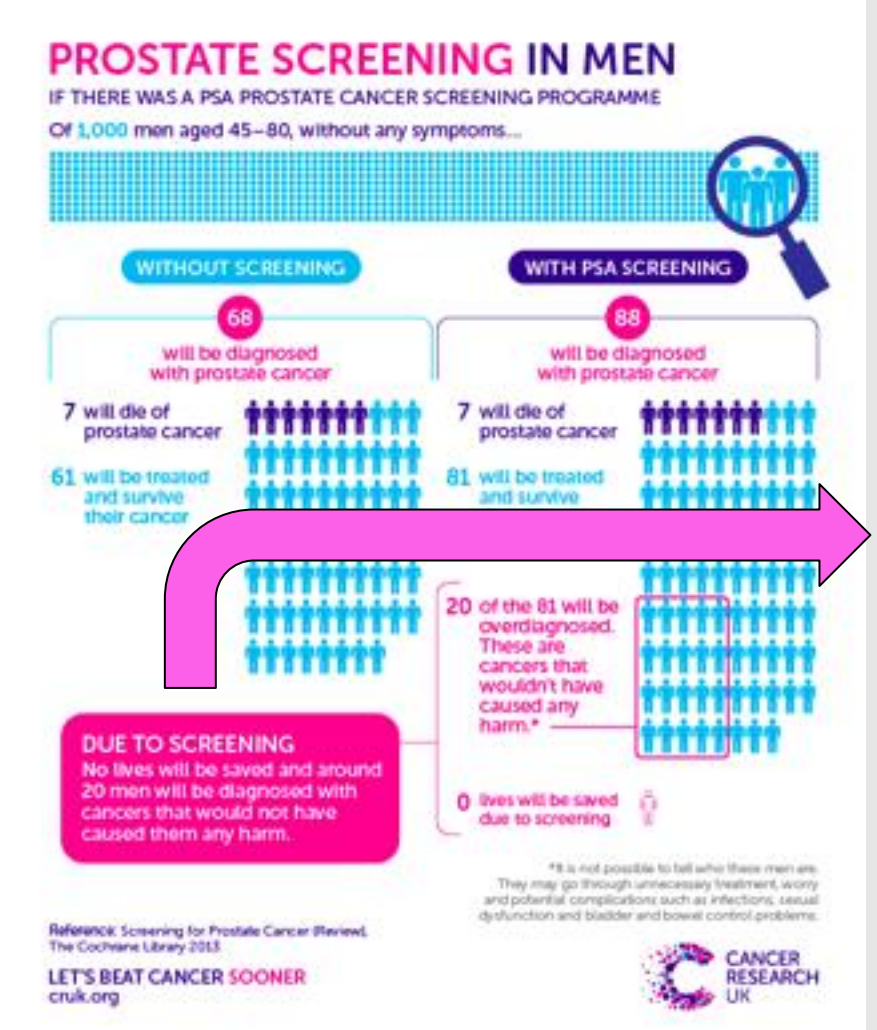
Prostate Cancer Screening Patient Information UK



Due to screening:

- **no lives will be saved**
- **around 20 men will be diagnosed with cancers that would not have caused any harm**

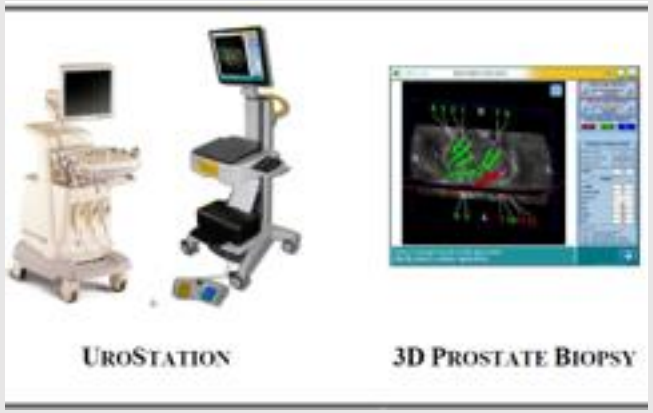
Individualised Early Detection of PCA

Potential Methods

- age-adapted risk groups
- hereditary risk
- mpMRI before biopsy
- kallikreins (4K)
- molecular serum markers (SNPs, MSI)
- urine markers (HOXC6, DLX1, T2:ERG)
- combinations

  (risk calculators from ERSPC and PCPT)

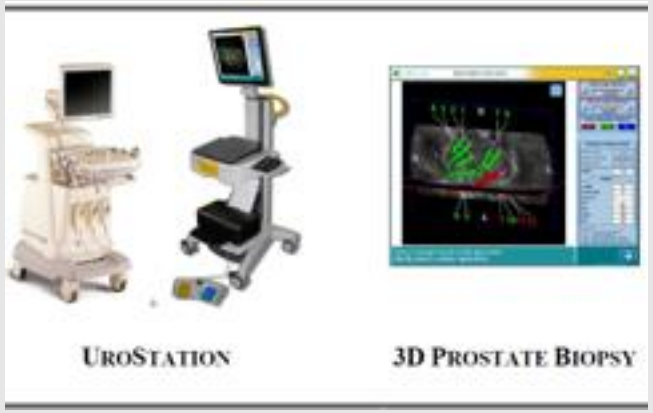


Individualised Early Detection of PCA

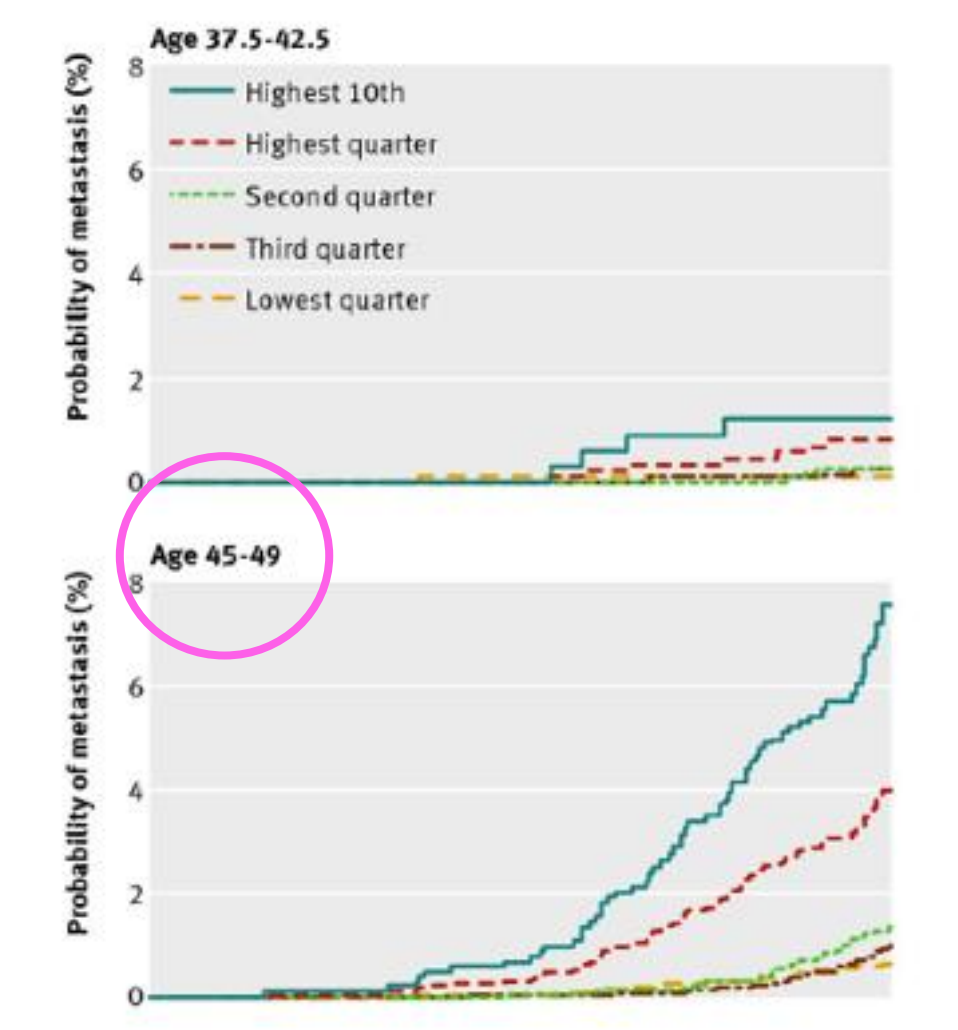
Potential Methods

- age-adapted risk groups
- hereditary risk
- mpMRI before biopsy
- kallikreins (4K)
- molecular serum markers (SNPs, MSI)
- urine markers (HOXC6, DLX1, T2:ERG)
- combinations

(risk calculators from ERSPC and PCPT)



Prediction of PCA metastasis by „baseline“ PSA



PSA at 45 yrs risk for metastasis after 25 yrs

PSA < 1.1 ng/ml 1.38%

PSA > 1.6 ng/ml up to 9.82%

➡ **~ 10x higher risk > 1.6 ng/ml**

Vickers A et al. BMJ 2013

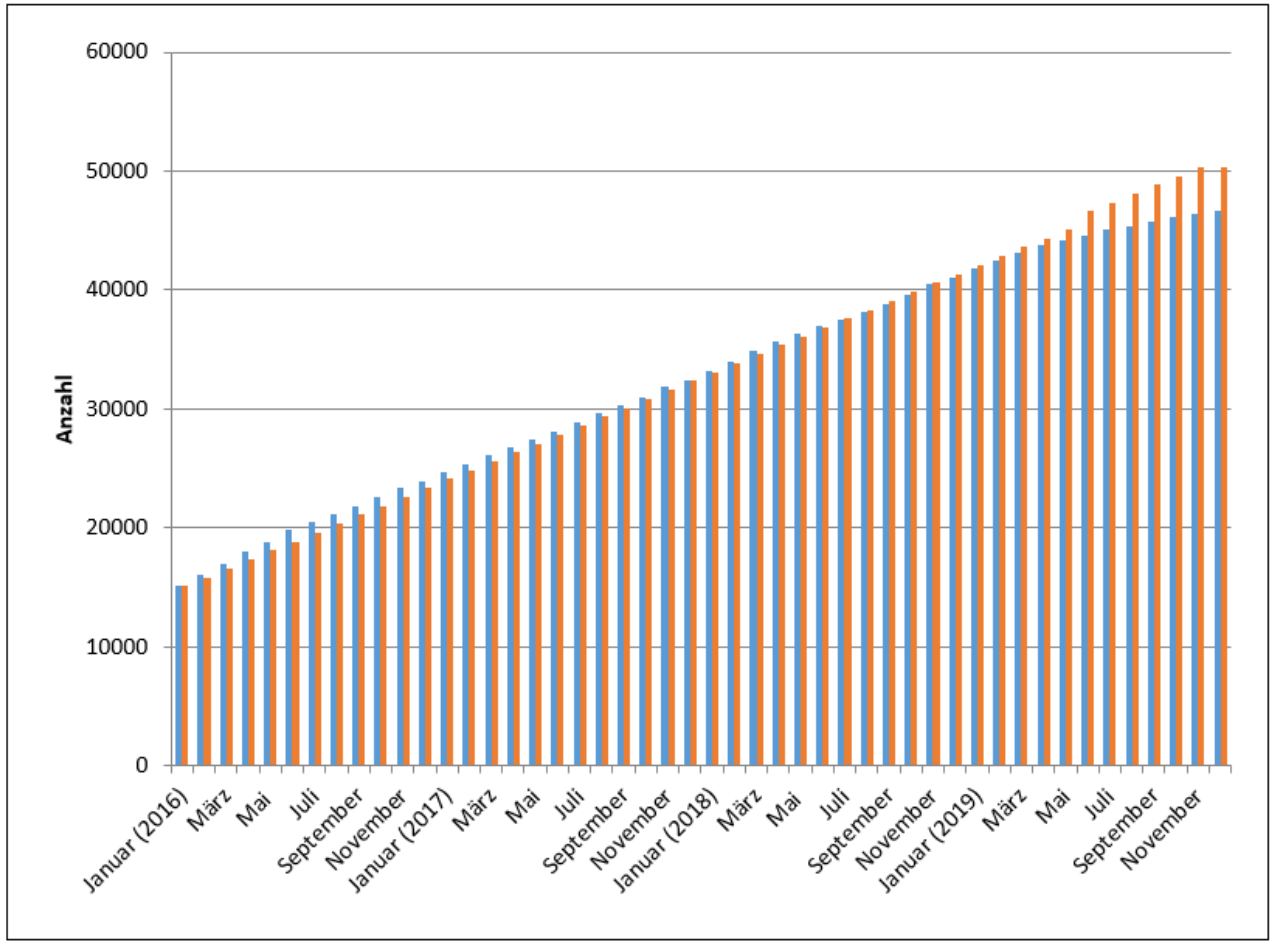
Accrual Feb 2014 – Dec 2019: 46,642 participants



expected
observed

ueg.eu

data cut-off Dec 31, 2019

Summary of the First Screening Round

- prevalence of prostate cancers at age 45 is very low (0.19%)
- prevalence of unfavorable prostate cancers is even lower (0.05%)
- prevalence of DRE - detected PCA is extremely low

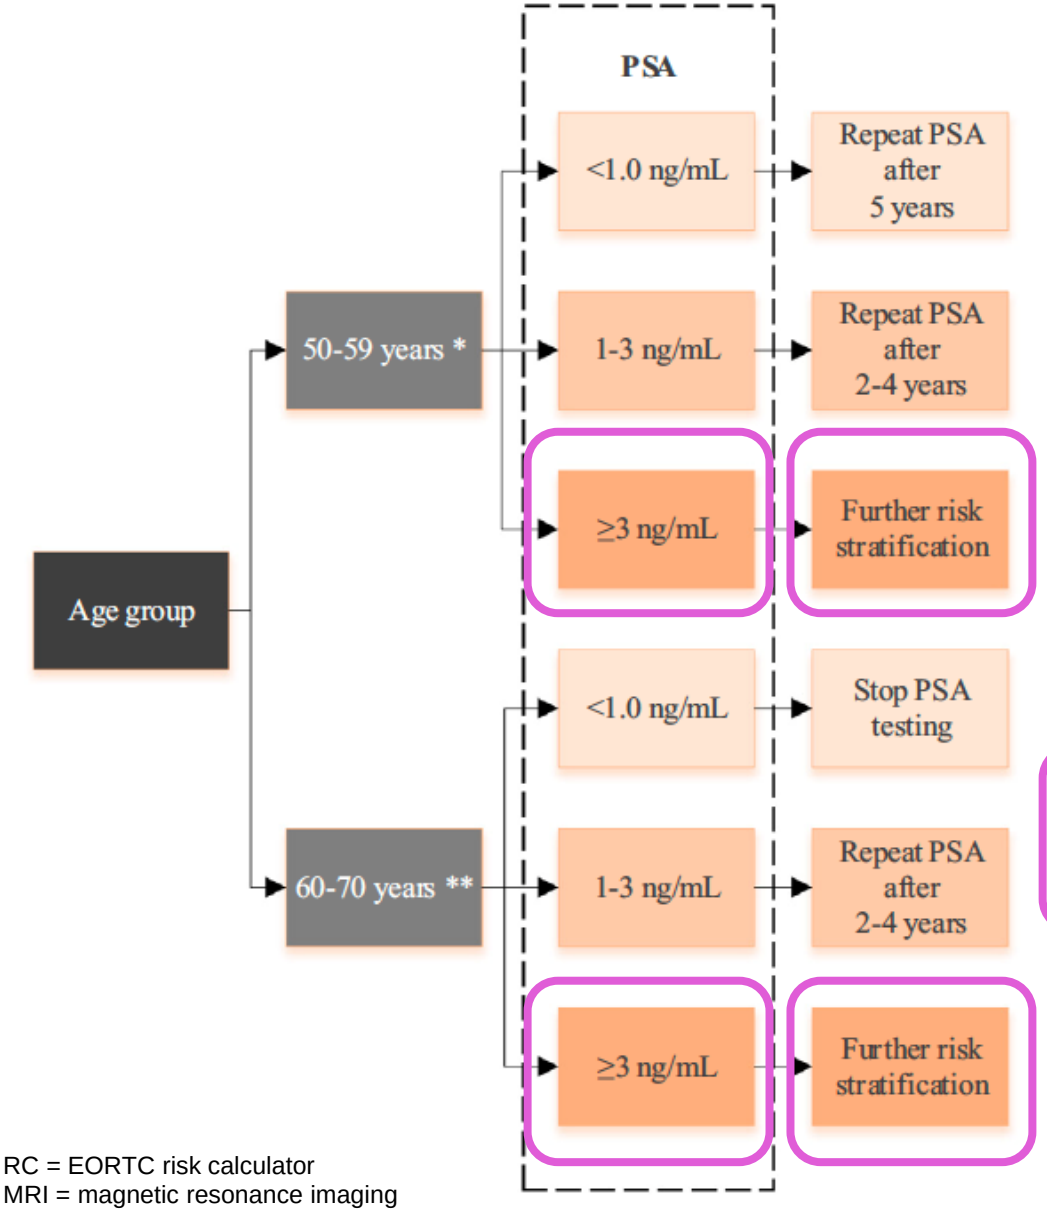
Platinum Opinion

Early Detection of Prostate Cancer in 2020 and Beyond: Facts and Recommendations for the European Union and the European Commission

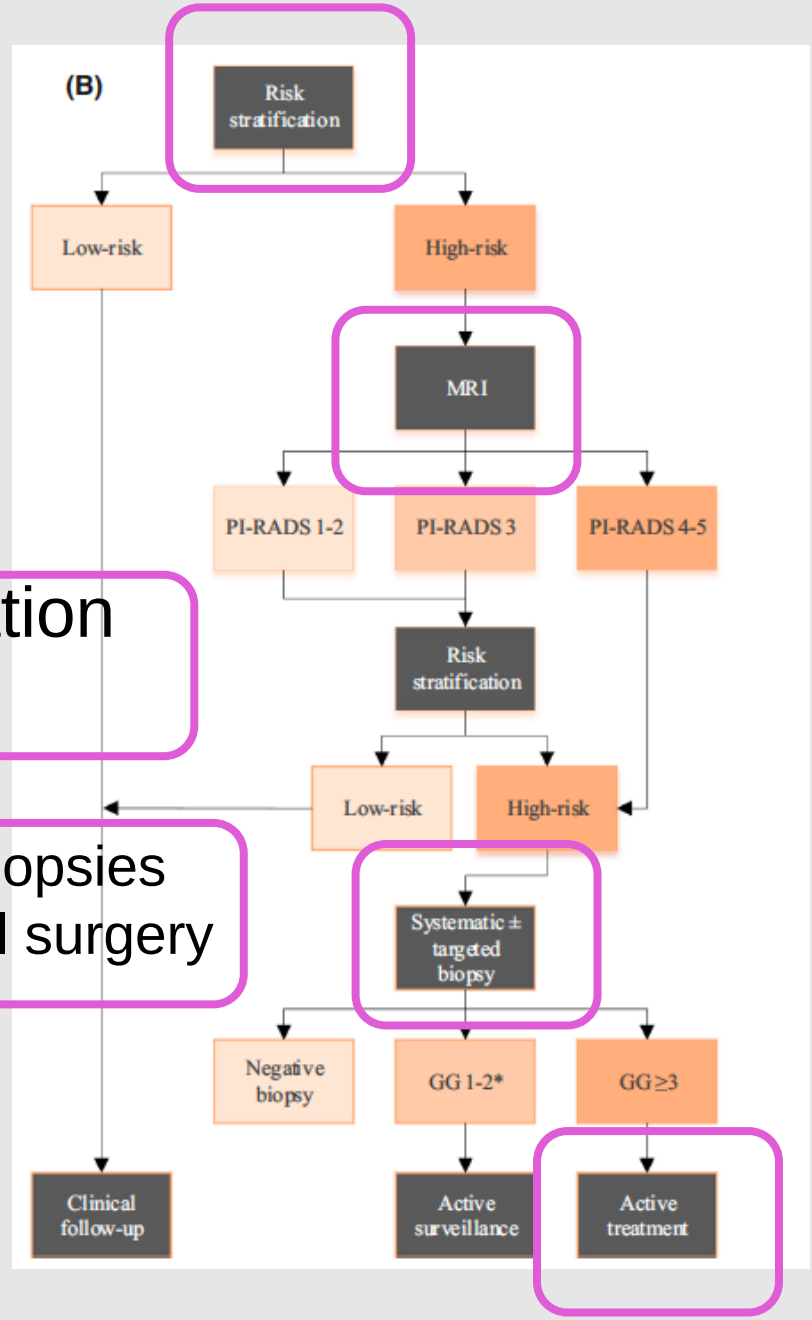
Hendrik Van Poppel[a,†,*], *Renée Hogenhout*[b,†], *Peter Albers*[c,d], *Roderick C.N. van den Bergh*[e], *Jelle O. Barentsz*[f,‡], *Monique J. Roobol*[b,‡]



RC = EORTC risk calculator
MRI = magnetic resonance imaging

Risk Stratification (RC, MRI)

avoids > 50% of biopsies and > 50% of radical surgery



Van Poppel H Eur Urol 2021

Take Home Messages

population-based PCa screening with PSA alone is obsolete

risk-adapted screening is possible and effective

> 50% of biopsies and overtreatment can be avoided

Thank you for your attention !

Advocacy Paper

- Advocacy Paper on Early Detection and Screening will be published in September, based on this meeting's presentations and discussions. It will outline today's key recommendations in the context of the implementation of Europe's Beating Cancer Plan and the EU Cancer Mission
- If you wish to input into the Advocacy Paper, contact Norbert Couespel norbert.couespel@europeancancer.org
- This Advocacy Paper will be used for further engagement with the European Parliament (including the Special Committee on Beating Cancer), the European Commission and EU agencies to take these recommendations forward
- Paper will also form the basis of our session at the European Cancer Summit 2021 on 17 November at 9:15-10:45 CET

Save the Date!
Session on Prevention, Early Detection & Screening
17 November 2021 at 9:15-10:45 CET

Prevention, Early Detection and Screening Network

The Prevention, Early Detection and Screening Network brings together a wide range of experts and stakeholders, from the European Cancer Organisation Member Societies, Patient Advisory Committee and other stakeholders, with the aim of driving fresh and stronger consensus in areas chosen by its participants for focus. **Please contact our CEO, Mike Morrissey, if you would like to join the Prevention, Early Detection and Screening Network (free-of-charge).**
